

Archon Autopilot

A Qwen AP agent that gathers evidence autonomously, but cannot move money on its own.

QWEN CLOUD · LIVE ALIBABA ECS · MIT

Qwen proposes. Human decides.

AP automation is valuable only if authority stays human.

Invoices are untrusted inputs, but payment consequences are real.

THE AP INBOX

Messy, untrusted invoices

- Duplicate and overbilling risk
- Evidence scattered across history
- Manual review and re-keying
- A wrong action can move real money

ARCHON AUTOPILOT

Evidence autonomy, bounded consequence

- qwen-vl reads the document
- A bounded Qwen loop recalls and checks
- Exactly one PENDING proposal is created
- A human approves the exact arguments

The model recommends. The authenticated human owns the consequence.

Archon Autopilot

Track 4 · bounded accounts-payable orchestration with a hard human consequence boundary

Alibaba ECS · HTTPS

Agentic reasoning lives inside a deterministic approval workflow.

The agent earns autonomy - then stops.

One visible path from untrusted invoice to durable human decision.

01 · SEE + REASON

Qwen reads, recalls and checks

02 · STOP AT PENDING

A durable proposal waits

03 · HUMAN DECIDES + MEMORY

Amendment becomes future evidence

Within the authored workflow model, active review falls from 100 to 36.5.

Indexed effort and checkpoints · manual baseline = 100

22/22

Tuned offline policy agreement

Developer-labelled deterministic regression; not live-Qwen accuracy.

2.4

Average autonomous evidence steps

53 total; all 22 scenarios required at least two steps.

0/12

Policy-label mismatches in each arm

0/12 manual vs 0/12 assisted; this does not establish error reduction.

Caveat: 12 authored synthetic cases and public task assumptions; not a human study, ROI estimate, throughput result or field trial.

Production readiness is enforced - not implied.

The model boundary, state machine, configured effects, security gates and hosted stress profile are independently inspectable.

BOUNDARY	ENFORCED BEHAVIOR	JUDGE-VERIFIABLE EVIDENCE
Model authority	The model catalog exposes proposal/read skills: no approve, reject, pay or terminal sink tool.	MCP catalog + adversarial tests
State transition	An authenticated reviewer atomically claims PENDING → EXECUTING before a decision can reach a sink.	Integration + Playwright E2E
Configured effects	SMTP transport acceptance and restart-safe JSONL are real; payment and specialist review remain simulated.	Sink/recovery tests + explicit scope
Quality & supply chain	Coverage 89.83 / 83.70 / 88.29 / 89.83, pen tests, CodeQL, immutable image, SBOM and Grype gate.	Hosted CI and release artifacts
Hosted ramp	50 VUs · 13,204 requests · 0 failures · 19.37 ms p95 on the isolated application path.	Fake-Qwen + in-memory; not live inference

Autonomy where judgment helps. Human authority where money moves.

Archon turns an untrusted invoice into an auditable proposal, then stops.

Qwen proposes · Human decides
